Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

MCP19035 600 kHz HIGH-VOLTAGE SYNCHRONOUS BUCK CONTROLLER REFERENCE DESIGN USER'S GUIDE

Chapter 1. Product Overview

1.1 INTRODUCTION

This chapter provides an overview of the MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design and covers the following topics:

- MCP19035 Short Overview
- What Is the MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design?
- What the MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design Kit Contains

1.2 MCP19035 SHORT OVERVIEW

The MCP19035 is a highly-featured, highly-integrated, synchronous buck controller in a space-saving 10-pin DFN 3x3 package that operates from input voltage sources up to 30V. Integrated features include high and low-side MOSFET drivers, fixed-frequency voltage mode control, internal oscillator and reference voltage generator, overcurrent protection circuit for both sides, Power Good circuit and overtemperature protection. A minimal number of external components are necessary to develop a complete, high-performance Synchronous Buck Converter power supply.

The MCP19035 Synchronous Buck Controller is intended to be used for applications requiring medium to high-output currents (up to 20A) and input voltages up to 30V.

Typical applications includes:

- Medium currents Point-of-Load converters
- FPGA/DSP power supplies
- USB power ports
- Digital Set-Top boxes
- Industrial 24V rail converters
- High-power LED drivers

The internal linear voltage regulator (LDO) allows low current loads (i.e., PIC[®] microcontrollers) to be powered directly from the controller without any additional components.

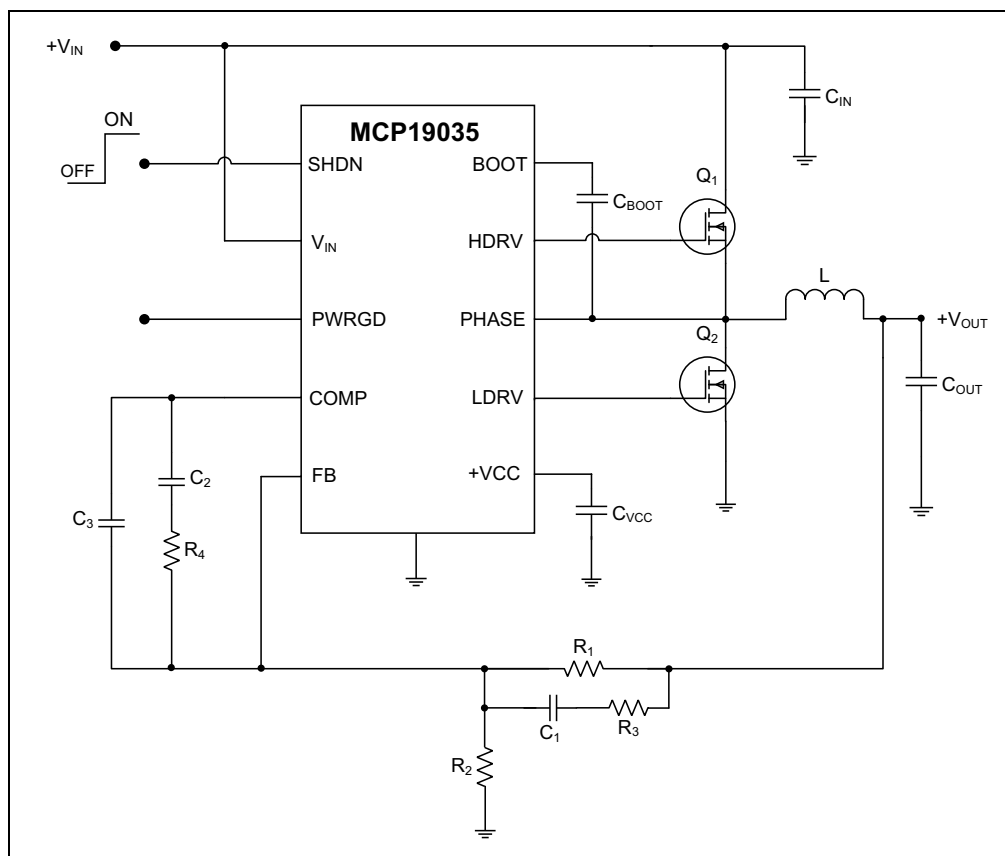

FIGURE 1-1: MCP19035 – Typical Application.

1.3 WHAT IS THE MCP19035 600 kHz HIGH-VOLTAGE SYNCHRONOUS BUCK CONTROLLER REFERENCE DESIGN?

The MCP19035 600 kHz Synchronous Buck Converter Controller is a compact, highly efficient, step-down voltage converter that will convert the input voltage rail (typically 24V) to 5V regulated output voltage. The maximum output current for this step-down converter is 5A. The board demonstrates the capabilities of the MCP19035 600 kHz Synchronous Buck Converter Controller in a typical high-voltage input step-down application. Test points for various signals are provided for measuring different parameters of the converter. The reference design can be modified to support output voltages from 3.3V to 5V by changing a single resistor.

1.4 WHAT THE MCP19035 600 kHz HIGH-VOLTAGE SYNCHRONOUS BUCK CONTROLLER REFERENCE DESIGN KIT CONTAINS

The MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design kit includes:

- MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design (ARD00514)
- Important Information Sheet

Chapter 2. Installation and Operation

2.1 INTRODUCTION

The MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design was developed to provide a compact, low-cost and highly efficient step-down conversion for low to medium output currents.

2.1.1 MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design Features

The MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design has the following key features:

- Input Voltage Range: 8V to 26V
- Output Voltage: 5V (can be adjusted by changing one resistor between 3.3V and 5V)
- Maximum output current: 5A
- 93% typical efficiency at 5V/5A output and 24V input
- 600 kHz fixed switching frequency
- Overcurrent protection for high and low-side MOSFETs
- Power Good (PGOOD) output for monitoring the output voltage quality
- Shutdown input for placing the converter in low-power Standby mode
- Undervoltage Lockout (UVLO) with 4.5V and 3.9V typical thresholds

2.2 GETTING STARTED

The MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design is fully assembled and tested to evaluate and demonstrate the MCP19035 capabilities.

2.2.1 Instruments and Tools Required

- Adjustable DC power supply with 0V-30V/5A_{DC} range output capability
- Electronic load with at least 5A current capability and load stepping capability
- Digital oscilloscope with a minimum bandwidth of 50 MHz
- Digital voltmeter/ammeter
- Optionally, a network analyzer/Bode plot analyzer for loop analysis
- Wires for connections; these wires must sustain high currents (5A for the connection between adjustable DC power supply and board, 5A for the connection between board and the electronic load)

2.2.2 Setup Procedure

To power up the MCP19035 600 kHz High-Voltage Synchronous Buck Controller Reference Design, the following steps must be completed:

1. Connect the electronic load to J2 connector of the reference design; the “positive” (+) and “negative” (-) connector pins are marked on the board silk-screen.
2. Connect the adjustable DC power supply to J1 connector of the reference design; the “positive” (+) and “negative” (-) connector pins are marked on the board silkscreen.
3. The DC voltage supplied by the adjustable DC power supply must be 24V.

2.2.3 Board Testing

The typical testing setup is depicted in [Figure 2-1](#). [Table 2-1](#) shows all the available test points on the board.

The user can connect various instruments at the listed test points to evaluate the parameters of the converter. The typical performance data, curves and waveforms are presented in [Appendix C. “Typical Performance Data, Curves and Waveforms”](#).

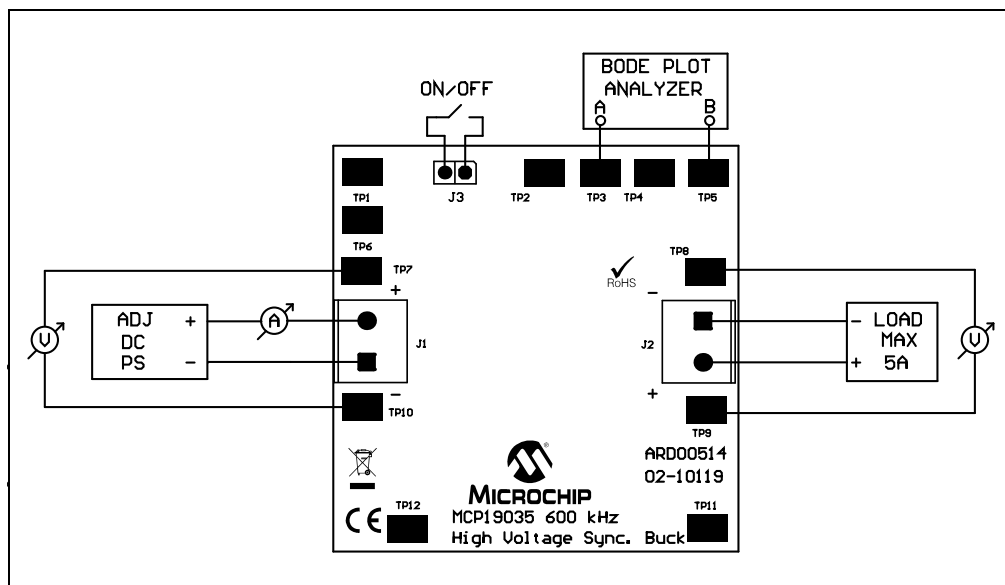

FIGURE 2-1: Typical Test Setup.

TABLE 2-1: TEST POINTS DESCRIPTION

Test Point	Label	Description
TP2, TP4, TP6, TP8, TP10, TP11, TP12	GND	Power GND
TP7	V_{IN}	Input voltage
TP1	PGOOD	Power Good output
TP9	V_{OUT}	Output voltage
TP3, TP5	CH A, CH B	Signal injection points for loop measurement

2.2.4 Adjusting the Output Voltage

The output voltage can be modified by changing the value of R12 from the feedback divider. The output voltage is set according to [Equation 2-1](#).

EQUATION 2-1: EQUATION OUTPUT VOLTAGE

$$V_{OUT} = V_{REF} \times \frac{R10 + R12}{R12}$$

Where:

$$V_{REF} = 0.6V$$

$$R10 = 20\text{ k}\Omega$$

Do not modify the value of the R10 resistor (20 kΩ) because this will affect the loop compensation of the system.

Some parameters like efficiency, the overcurrent protection thresholds and the input and output voltage ripples can be affected by the modification of the output voltage. Do not exceed 6V for the output voltage or permanent damage of the board can occur.

[Table 2-2](#) shows the standard values of R12 resistor for some usual output voltages.

TABLE 2-2: OUTPUT VOLTAGE VERSUS R12 VALUE

5	2.74
